AB Disclosed are novel CRF receptor antagonists and their use in the treatment of a variety of disorders, including disorders manifesting hypersecretion of CRF, or associated with CRF or CRF receptors, such as anxiety, and depression. The CRF receptor antagonists of the invention have the structure of formula I (R = H or Me), including stereoisomers or mixts. of stereoisomers, pharmaceutically acceptable prodrugs, or pharmaceutically acceptable salts. Compds. I were tested in several biol. assays, and had IC50 values of less than 3 nM in a CRF1 receptor binding assay. For example, 4-bromo-3-methylanisole was treated with t-BuLi followed by reaction with α-methyl-γ-butyrolactone to give a ring-opened hydroxy ketone, which underwent Swern oxidation to yield the corresponding formyl ketone. This dicarbonyl compound was cyclized with N-aminophthalimide to afford pyrrole II, which was deprotected with hydrazine and then converted to hydroxybicycle III via cyclocondensation with Et trans-3-ethoxycrotonate. Bromination of III with PBr3 followed by amination of the resulting bromide with (S)-sec-butylamine led to pyrrolo[1,2-b]pyridazine (S)-I (R = H). Claimed uses also include (1) use of labeled compds. I in competitive binding assays for screening of other CRF receptor ligands, and (2) use of labeled I for detecting CRF receptors in tissues.
